Rational Classification of Simple Function Space Components for Flag Manifolds

Samuel Bruce Smith

May 20, 1997

Abstract

Let $M(X, Y)$ denote the space of all continuous functions between $X$ and $Y$ and $M_f(X, Y)$ the path component corresponding to a given map $f : X \to Y$. When $X$ and $Y$ are classical flag manifolds, we prove the components of $M(X, Y)$ corresponding to "simple" maps $f$ are classified up to rational homotopy type by the dimension of the kernel of $f$ in degree two cohomology. In fact, these components are themselves all products of flag manifolds and odd spheres.

1. Introduction. When $X$ and $Y$ are flag manifolds or, more generally, $F_0$-spaces (simply connected finite complexes with finite-dimensional rational homotopy and no rational cohomology in odd degrees), the rational classification problem for components of the function space $M(X, Y)$ intersects two basic areas of research. First, W. Meier [10] proved the identity component $M_1(X, X)$ for an $F_0$-space $X$ is rationally a product of odd spheres if and only if the rational Serre spectral sequence collapses for any orientable fibration.

1991 Mathematics Subject Classification. Primary 55P62, 55P15, 58D09.

Key words and phrases. Rational homotopy theory, Sullivan-Haefliger model
with fibre $X$. Thus identifying the rational homotopy type of this particular function space component is equivalent to resolving the Halperin conjecture for $F_0$-spaces. Second, the rational classification of components is directly related to the problem of describing the set $[X, Y]_\mathbb{Q}$ of maps between the rationalizations of $X$ and $Y$. For convenience, we denote this set by $[X, Y]_\mathbb{Q}$. When $X = Y$ is a generalized complex flag manifold this latter problem has been studied extensively by several authors (see [4, 9]) with particular emphasis on the group $\mathcal{E}(X, \mathbb{Q})$ of rational self-equivalences. By [1, Corollary 3.6] the set $[X, Y]_\mathbb{Q}$ for $F_0$-spaces is in bijection with $\text{Hom}(H^*(Y, \mathbb{Q}), H^*(X, \mathbb{Q}))$ and so determining its structure is a purely algebraic problem. Nonetheless, there appears to be no general structure theorem in the literature for the rational maps between two different flag manifolds. In this paper, we focus on the large class of “simple” and “signed-simple” maps between flag manifolds and classify the components corresponding to these maps in the complex and symplectic cases.

Let $X = G_1/T$ and $Y = G_2/T$ be flag manifolds where $G_1$ and $G_2$ are compact, connected Lie groups and $T$ denotes a maximal torus of appropriate rank. By [2], $H^i(G_i/T) = B_i/J_i$, $i = 1, 2$, where $B_i$ is the polynomial algebra on $\text{rank}(G_i)$ variables generated in degree two and $J_i$ is the ideal consisting of polynomials invariant under the action of the Weyl group $W_i$ of $G_i$ on the subscripts of the variables. (Here and throughout, all (co)homology and homotopy groups are taken to have rational coefficients.) Write $B_1 = \Lambda_2(t_1, \ldots, t_k)$
and $B_2 = \Delta_2(x_1, \ldots, x_r)$ where $k = \text{rank}(G_1)$ and $n = \text{rank}(G_2)$.

**Definition.** A map $f : X \to Y$ between flag manifolds is simple (respectively, signed-simple) if there is $a \in \mathcal{F}$ such that for each $x_i \in B_2$ if $\phi(x_i) \neq 0$ then $\phi(x_i) = a \cdot t_j$ (resp., $\phi(x_i) = -a \cdot t_j$) for some $t_j \in B_1$ where $\phi : B_2 \to B_1$ is the map induced by $f$.

Examples of simple maps arise naturally from the basic inclusions $U(k) \hookrightarrow U(n)$ and $Sp(k) \hookrightarrow Sp(n)$ for $k \leq n$ and of signed-simple maps via $Sp(k) \hookrightarrow U(n)$ for $2k \leq n$. In §2, we show that the simple maps in $[U(k)/T, U(n)/T]$ and $[Sp(k)/T, Sp(n)/T]$ are classified by the integer $l = (n - \dim(\ker(H^2(f))))/k$ and the signed-simple maps in $[Sp(k)/T, U(n)/T]$ by the integer $l = (n - \dim(\ker(H^2(f))))/2k$. Using an explicit construction of the Haefliger model for $F_0$-spaces (§3), we establish

**The Classification Theorem.** Let $f$ be a simple or signed-simple map between complex or symplectic flag manifolds and let $l$ be as above. Then

\[ M_f(U(k)/T, U(n)/T) \cong (U(l)/T)^k \times U(l-1)/T \times U(n-kl)/T \times \text{odd spheres} \]

\[ M_f(Sp(k)/T, Sp(n)/T) \cong (U(l)/T)^k \times Sp(n-kl)/T \times \text{odd spheres} \]

\[ M_f(Sp(k)/T, U(n)/T) \cong (U(l)/T)^{2k-1} \times U(l-1)/T \times U(n-2kl)/T \times \text{odd spheres}. \]

\[ \square \]

2. **Rational Maps Between Flag Manifolds.** Let $X = G_1/T$ and $Y = G_2/T$ be flag manifolds, as above. Since rational self-equivalences of $X$ and $Y$ induce rational equivalences between components of $M(X, Y)$, for our
purposes we need only determine the structure of the set $[X, Y]_{\Phi}$ "modulo rational equivalences". In other words, we identify rational maps $f : X \to Y$ up to pre- and post-composition by rational self-equivalences in $Y$ and $X$, respectively.

The Weyl group of a compact Lie group is a finite reflection group and so may be viewed as a subgroup of the orthogonal group. Thus the polynomials $P_{2,1}(t_1, \ldots, t_r) = t_1^2 + \cdots + t_r^2$ and $P_{2,2}(x_1, \ldots, x_n) = x_1^2 + \cdots + x_n^2$ are elements of the ideals $J_1$ and $J_2$ of grade four. If $G_1$ is simple then $P_{2,1}$ is (up to scalar multiple) the unique element of grade four in $J_1$ (see, e.g., [8, p. 59]). If $G_1 = U(k)$ then the element $t_1 + \cdots + t_k$ of grade two appears in $J_1$ and so $P_{2,1}$ is not unique. However, if we replace $B_1$ by $B_1' = \Lambda_2(t_1, \ldots, t_{k-1})$, $J_1$ by the appropriate subideal $J_1'$ and set $t_k = -t_1 - \cdots - t_{k-1}$, then the polynomial $P_{2,1}(t_1, \ldots, t_k)$ appears and is the unique element of grade four in $J_1'$. We use this uniqueness to prove

**Theorem 2.1** Let $X = G_1/T$ and $Y = G_2/T$ with $G_1$ simple or $U(k)$. Let $f : X \to Y$ be any map. Then $f^* : H^*(Y) \to H^*(X)$ is either trivial or surjective.

**Proof.** Suppose $f^* : H^2(Y) \to H^2(X)$ is nontrivial. Let $a_1 = \phi(x_1^2)$. Then, making the above replacement if necessary, we have $\phi(P_{2,2}) = \alpha P_{2,1}$ for some $\alpha \in \Phi$. If $\alpha = 0$ then $a_1^2 + \cdots + a_n^2 = \phi(P_{2,2}(x_1, \ldots, x_n)) = 0$ which implies each $a_j = 0$, contrary to our assumption. Thus $\alpha \neq 0$ and we have a nontrivial identity of the form $P_{2,2}(a_1, \ldots, a_n) = \alpha P_{2,1}(t_1, \ldots, t_k)$. Viewing
the $a_j$ as linear endomorphisms $a_j(t_1, \ldots, t_k)$ of the vector space $\mathcal{Q}(t_1, \ldots, t_k)$, we take $\frac{\partial}{\partial t_i}$ of both sides and obtain
\[
\alpha \cdot t_i = \sum_{j=1}^{n} a_j \cdot \frac{\partial a_j}{\partial t_i}.
\]
Thus $\mathcal{Q}(a_1, \ldots, a_n) = H^*(X)$. □

**Corollary 2.2** Let $X = G/T$ with $G$ simple or $G = U(k)$. Then $[X, X]_{\mathcal{Q}} = \mathcal{E}(X_{\mathcal{Q}}) \cup \{0\}$. □

While the set $[X, Y]_{\mathcal{Q}}$ modulo rational equivalences is fairly simple when $k = \text{rank}(G_1) \geq \text{rank}(G_2) = n$, when $k < n$ the structure is apparently much more complicated. We focus on the simple maps.

**Theorem 2.3** Let $X = G_1/T$ and $Y = G_2/T$ with $G_1$ simple or $U(k)$ such that the Weyl group of $G_2$ contains the symmetric group $S_n$. Then $[X, Y]_{\mathcal{Q}}$ contains at most $[n/k]+1$ distinct simple maps modulo rational equivalences. If $G_1$ is simple and $G_2 = U(k)$ then $[X, Y]_{\mathcal{Q}}$ contains at most $[n/2k]+1$ distinct signed-simple maps modulo rational equivalences.

**Proof.** Let $f : X \to Y$ be simple. Then, after permuting the subscripts of the $x_i$ (rational equivalence in $Y$), we may assume $\phi(x_1) = \cdots = \phi(x_l) = c \cdot t_1$ for some $l$. Thus the coefficient of $t_1^2$ in $\phi(P_{22})$ is $l \cdot a^2$. By the uniqueness of $P_{21}$ in $J_1$, it follows that, after further permutation of subscripts, the list \{x_1, \ldots, x_n\} splits into $k+1$ sublists, \{x_1, \ldots, x_l\}, \ldots, \{x_{(k-1)i+1}, \ldots, x_i\} and \{x_{i+1}, \ldots, x_n\} with the property that $\phi(x_j) = c \cdot t_i$ for $x_j$ in the $i$th sublist.
\( i = 1, \ldots, k \) and \( \phi(x_j) = 0 \) for \( x_j \) in the \( k+1 \)st sublist. Since multiplication by \( a \) in degree two cohomology induces a rational equivalence of \( X \), the first statement follows.

For the second statement, observe that \( \phi(x_1 + \cdots + x_n) = 0 \). Using the previous case, we see that, after permutation, \( \{x_1, \ldots, x_n\} \) splits into \( 2k + 1 \) sublists, the first \( 2k \) of length \( l \), such that \( \phi(x_j) = a \cdot \tau_i \) for \( x_j \) in the \( i \)th and \( \phi(x_j) = -a \cdot \tau_i \) for \( x_j \) in the \( 2i + 1 \)st sublist, \( i = 1, \ldots, k \), while \( \phi(x_j) = 0 \) for \( x_j \) in the \( 2k + 1 \)st sublist. \( \Box \)

For each \( l = 0, \ldots, [n/k] \) the inclusion \( \prod_{i=1}^l U(k) \hookrightarrow U(n) \) induces a map \( \hat{i}_l \) \( : \prod_{i=1}^l U(k)/T \to U(n)/T \). Define \( f_l : U(k)/T \to U(n)/T \) by setting \( f_l = \Delta \circ \hat{i}_l \) where \( \Delta : U(k)/T \to \prod_{i=1}^l U(k)/T \) is the diagonal map. It is clear that the \( f_l \) are simple and rationally distinct. This construction can be applied, as well, to the other classical inclusions (§1) and so

**Corollary 2.4** Modulo rational equivalences, the sets \([U(k)/T, U(n)/T]_q\) and \([Sp(k)/T, Sp(n)/T]_q\) contain exactly \([n/k] + 1\) distinct simple maps while \([Sp(k)/T, U(n)/T]_q\) contains exactly \([n/2k] + 1\) distinct signed-simple maps.

\( \Box \)

3. The Haefliger Model for \( F_0 \)-Spaces. By [6], the minimal model \( (\mathcal{M}_Y, d_Y) \) for an \( F_0 \)-space \( Y \) is a two-stage DGA; specifically, \( \mathcal{M}_Y = \Lambda(V_0) \otimes_{d_Y} \Lambda(V_1) \) where \( V_0 \) is evenly graded, \( V_1 \) oddly graded and where the differential \( d_Y \) satisfies \( d_Y|V_0 = 0 \) and \( d_Y(V_1) \subseteq \Lambda(V_0) \). This simple rational structure implies the Haefliger model for components of \( M(X, Y) \) admits a
direct and accessible construction when \(X\) and \(Y\) are \(F_\infty\)-spaces. Our argument follows the line of proof of [13, Theorem 3] which, in turn, was based on the methods of [11].

**Theorem 3.1** Let \(f : X \to Y\) be a map between \(F_\infty\)-spaces with \(\mathcal{M}_Y = \Lambda(V_0) \otimes_{d_f} \Lambda(V_1)\). There is a two-stage model \(\mathcal{A}_f = \Lambda(Z_0) \otimes_{d_f} \Lambda(Z_1)\) for the function space component \(M_f(X, Y)\) with

\[
Z_0^n = \bigoplus_{i=0}^\infty H_2^i(X) \otimes V_0^{2i+m} \quad \text{and} \quad Z_1^n = \bigoplus_{i=0}^\infty H_1^i(X) \otimes V_1^{2i+m}.
\]

**Proof.** By [7, Theorem B] we may assume \(Y\) is a rational space. We view \(Y\) as the total space of a principal fibration with base \(K_0 = \Pi_i K(\text{Hom}(V_0^i, \mathcal{Q}), i)\) and fibre \(K_1 = \Pi_i K(\text{Hom}(V_1^i, \mathcal{Q}), i)\). Observe that \(M(X, K_1)\) is connected since \([X, K_1] = \bigoplus_i H^i(X) \otimes V_i^i\) and \(H^*(X)\) is evenly graded while \(V_i^1\) is oddly graded. Thus applying the mapping space functor to the classifying fibration for \(Y\) we obtain the diagram

\[
\begin{array}{ccc}
M_f(X, Y) & \xleftarrow{p} & M(X, K_1) & \subset & M(X, PK_1) \\
\downarrow & & \downarrow & & \downarrow \\
M_{\mathcal{G}f}(X, K_0) & \xrightarrow{k} & M_0(X, BK_1)
\end{array}
\]

Since the obstructions to lifting a homotopy between \(p \circ f, p \circ g : X \to K_0\) to a homotopy between \(f, g : X \to Y\) lie in the trivial groups \(H^n(X, \pi_r(K_1))\), this is a pull-back diagram. By the classical result of Thom [15] on the space of maps into an Eilenberg MacLane space, \(p_\infty\) is a principal fibration. The
Hirsch Lemma ([3, Lemma 4.1]) applied to $p$ implies there is a two-stage model for $M_f(X, Y)$ of the form $A_f = H^*(M_{pof}(X, K_0)) \otimes_{df} H^*(M_0(X, K_1))$. The result now follows from Thom's result. □

We pursue applications of this model for general $F_0$-spaces in [14] and consider here only the case when $Y$ is cohomologically generated in degree two. In this case, $M_Y = \Lambda_2(x_1, \ldots, x_n) \otimes_{df} \Lambda(V_1)$ and so $A_f = \Lambda_2(x_1, \ldots, x_n) \otimes_{df} \Lambda(Z_1)$ where $Z_1^m = \bigoplus_{i=0}^\infty H_2(X) \otimes V_{2i}^{2i+m}$. Given $b \in H_2(X)$ we view $b$ as an element of the dual space to $H^*(X)$ and write $b(a) \in Q$ for the value of $b$ on $c \in H^*(X)$. Let $a_i = f_i(x_i) \in H^2(X)$ and write $c = (c_1, \ldots, c_n)$ to denote an $n$-tuple of non-negative integers with $|c| = \sum_{i=1}^n c_i$. Regarding the differential $d_f$ we have

**Theorem 3.2** Let $f : X \to Y$ be a map between $F_0$-spaces with $Y$ cohomologically generated in degree two. Given $b \otimes y \in H^2(X) \otimes V_1^{2i+m} \subset Z_1^m$ write $d_Y(y) = P(x_1, \ldots, x_n)$ for some homogeneous polynomial $P$. Then

$$d_f(b \otimes y) = \sum_{|c| = |c|} \frac{1}{c_1! \cdots c_n!} \cdot b(c_1 \cdots c_n) \cdot \frac{\partial P}{\partial x_1^{c_1} \cdots \partial x_n^{c_n}} (x_1, \ldots, x_n).$$

**Proof.** By the Hirsch Lemma, $d_f(b \otimes y) = L^*(b \otimes y) \in H^*(M_{pof}(X, K_0)) \cong \Lambda_2(x_1, \ldots, x_n)$. Let $\varepsilon_{pof} : X \times M_{pof}(X, K_0) \to K_0$ be the evaluation map. Then [13, Lemma 7.2] $\varepsilon_{pof}^*(x_i) = 1 \otimes x_i + (p \circ f)^*(x_i) \otimes 1 = 1 \otimes x_i + a_i \otimes 1$, for $x_i \in H^2(K_0)$. Given $b \in H_2(X)$ and $a \otimes P \in H^*(X \times M_{pof}(X, K_0))$
following Haefliger write \( b \cap (a \otimes P) = b(a)P \in H^*(K_0) \). By [13, Lemma 7.1]

\[
d_f(b \otimes y) = k^*(b \otimes y) = b \cap \varepsilon^*_{\rho_{a_1}}(k^*(y)) = b \cap \varepsilon^*_{\rho_{a_1}}(P(x_1, \ldots, x_n)) = b \cap P(\varepsilon^*_{\rho_{a_1}}(x_1), \ldots, \varepsilon^*_{\rho_{a_1}}(x_n)) = b \cap P(a_1 \otimes 1 + 1 \otimes x_1, \ldots, a_n \otimes 1 + 1 \otimes x_n).
\]

The result now follows from the identity

\[
P(a_1 \otimes 1 + 1 \otimes x_1, \ldots, a_n \otimes 1 + 1 \otimes x_n) = \sum_{[H] \in \pi_1} \frac{1}{[c_1! \cdots c_n!]} a_1^{c_1} \cdots a_n^{c_n} \frac{\partial^{[H]}}{\partial x_1^{c_1} \cdots \partial x_n^{c_n}} P(x_1, \ldots, x_n).
\]

\[\square\]

To determine the rational homotopy type of \( M_f(X, Y) \) for \( F_0 \)-spaces we must construct the minimal model for the DGA \( (A_f, d_f) \). In many cases, this can be done by simply computing the image of the differential \( d_f \) in \( A(Z_0) \). The elements of \( Z_1 \) giving “superfluous relations” correspond to odd spheres whose degrees can be computed directly. We give some

3.3. Examples. (a) Let \( X \) and \( Y \) be \( F_0 \)-spaces with \( Y \) cohomologically generated in degree two. Then \( M_0(X, Y) \cong \mathbb{Q} Y \times \text{odd spheres} \). See [14] for an extension of this result.

(b) When \( X = G/T \) is a flag manifold with \( G \) simple or \( U(k) \), Corollary 2.2 implies there are at most two rationally distinct components of \( M(X, X) \).

By (a) and the (known case of the) Halperin conjecture [12] we have

\[
M_f(G/T, G/T) \cong \mathbb{Q} \begin{cases} 
G/T \times \text{odd spheres} & f \text{ rationally null} \\
\text{odd spheres} & \text{otherwise}
\end{cases}
\]
(c) Let $X = U(n+2)/U(1)^2 \times U(n)$ for $n \geq 1$. The minimal model $(\mathcal{M}_X, d_X)$ is $\mathcal{M}_X = \Lambda_2(x_1, x_2) \otimes_{d_X} \Lambda(y_{n+1}y_{n+2})$, with $d_X(y_m) = T_m(x_1, x_2)$ where $T_m(x_1, x_2) = \sum_{i=0}^{n} x_1^i x_2^{n-i}$ [4]. Thus $\mathcal{M}_F = \Lambda_2(x_1, x_2) \otimes_{d_f} \Lambda(Z_1)$. If $n$ is odd [4, Theorems 1.3, 1.4] imply $[X, \mathcal{F}] = \mathcal{E}(X, \mathcal{F}) \cup \{0\}$. Let $n$ be even and suppose $f$ is rationally nontrivial. If $f^*$ is not a rational equivalence then by [4, Theorem 1.4] $f$ is a “projective map” and so (swapping subscripts if necessary) $f^*(x_1) = \alpha x_1$ and $f^*(x_2) = -\alpha x_1$ for some $\alpha \neq 0$. We may assume $\alpha = 1$.

Let $b_k \in H_{2k}(X)$ be dual to $x^k_1 \in H^{2k}(X)$ for $k = n, n + 1$. By Theorem 3.2

$$d_f(b_n \otimes y_{n+1}) = \sum_{|l| = n} (\frac{1}{(c_1, b_2)} b_n(x^l_1, x^2_2) \frac{\partial}{\partial x^l_1} \frac{\partial}{\partial x^2_2} T_{n+1}(x_1, x_2)$$

$$= \sum_{c_2 = 0}^{n} (-1)^{c_2} [n + 1 - c_2] x_1 + [c_2 + 1] x_2.$$ 

Since $n$ is even, we see $d_f(b_n \otimes y_{n+1}) = \frac{a_2 + 2}{2} (x_1 + x_2)$ and $d_f(b_{n+1} \otimes y_{n+2}) = \frac{a_2 + 2}{2} (x_1 - x_2)$, thus $d_f : Z_1 \to \Lambda_2(x_1, x_2)$ is surjective and we have shown

$$M_f(X, X') \cong \mathcal{F} \left\{ \begin{array}{ll}
X \times \text{odd spheres} & f \text{ rationally null} \\
\text{odd spheres} & \text{otherwise}.
\end{array} \right.$$ 

(d) Let $Y = \bigoplus_{j=1}^{k} F^{p_j}$ and $X$ any $F_0$-space. We show the components of the space $M(X, Y)$ are classified by the “heights” in $H^*(X)$ of the images of the generators of $H^*(Y)$ under $f$. Given $f : X \to Y$ let $b_j$ be zero if $f^*(x_j) = 0$ and otherwise $b_j = \max\{m | f^*(x_j^m) \neq 0\}$, where the $x_j \in H^2(X)$ are the generators. Write $M_Y = \Lambda_2(x_1, \ldots, x_k) \otimes_{d_Y} \Lambda(y_{n+1}, \ldots, y_{n+k})$ where $d_Y(y_{j+1}) = x_j^{n_j+1}$. Let $b_{jm} \in H_{2n}(X)$ be dual to $f^*(x_j^m) \in H^{2m}(X)$. By
Theorem 3.2, the image of $d_f$ is generated by the elements
\[ d_f(b_{j,m} \otimes y_{n,j+1}) = \frac{1}{m!} \frac{\partial^n}{\partial x_j^{n} \partial y_{n,j+1}^{m}} \left( \binom{n}{m} \right) x_j^{n-m+1}, \]
for $m = 0, \ldots, k_j$; that is, by the monomial $x_j^{n-m+1}$. Thus
\[ M_f \left( X, \Pi_{j=1}^k \mathcal{C}^{P^{n,j}} \right) = \Pi_{j=1}^k \mathcal{C}^{P^{n-j,k_j}} \cong \text{odd spheres}. \]

4. Simple Components. We classify the simple and signed-simple components of maps into a complex or symplectic flag manifold. Define
\[ P_m(x_1, \ldots, x_n) = \sum_{i=1}^n x_i^{m_i}, \quad T_m(x_1, \ldots, x_n) = \sum_{i=1}^n x_i^{m_i} \ldots x_i^{n_i} \]
and
\[ S_{2m}(x_1, \ldots, x_n) = \sigma_m(x_1^2, \ldots, x_n^2), \]
where $\sigma_m$ is the $m$th symmetric function in $n$ variables. It is easy to prove the ideals $(T_1, \ldots, T_n), (P_1, \ldots, P_n)$ and $(\sigma_1, \ldots, \sigma_n)$ coincide in the polynomial algebra $\Lambda_2(x_1, \ldots, x_n)$. The minimal model for $X = U(n)/T$ can thus be written $\mathcal{M}_X = \Lambda_2(x_1, \ldots, x_{n-1}) \otimes_{d_X} \Lambda(y_2, \ldots, y_n)$ where $|y_m| = 2m - 1$ and $d_X(y_m) = T_m(x_1, \ldots, x_{n-1})$ [4]. The minimal model $Y = Sp(n)/T$ is of the form $\mathcal{M}_Y = \Lambda_2(x_1, \ldots, x_n) \otimes_{d_Y} \Lambda(y_2, \ldots, y_{2n})$ where $|y_{2n}| = 4m - 1$ and $d_Y(y_{2n}) = S_{2n}(x_1, \ldots, x_n)$.

We will partition variable lists like $\{x_1, \ldots, x_n\}$ into sublists like $\{x_1, \ldots, x_i\}$, $\{x_{i+1}, \ldots, x_{2i}\}$, \ldots. For convenience, we let $P_m;i$ denote $P_m$ applied to the $i$th variable sublist. Also, given a nonnegative integer $c_i$ we define linear operators $D_i(c_i)$ on $\Lambda_2(x_1, \ldots, x_n)$ by
\[ D_i(c_i) = \sum_{l=0}^{\binom{n}{i}} \frac{1}{(d_1! \cdots d_i!)} \frac{\partial^i}{\partial x_{(i-1)+1}^{d_1} \cdots \partial x_{i}^{d_i}}. \]
where the variables $x_j$ are those in $i$th sublist. The following formula regarding partial derivatives of $T_m = T_m(x_1, \ldots, x_n)$ and $S_{2m} = S_{2m}(x_1, \ldots, x_n)$ are proved consecutively by inductive arguments.

(1) \[ \sum_{i=1}^{l} \frac{\partial}{\partial x_i} T_{m+1} \equiv P_{m,1} \mod (T_1, \ldots, T_m) \]

(2) \[ \sum_{i=1}^{l} \frac{\partial^2}{\partial x_i^2} T_{m+2} \equiv 2(m+1)P_{m,1} \mod (T_1, \ldots, T_m) \]

(3) \[ \sum_{i=1}^{l} \sum_{j=i+1}^{n} \frac{\partial^2}{\partial x_i \partial x_j} T_{m+2} \equiv \binom{l}{2} (P_{m,1} + P_{x,2}) \mod (P_{1,1}, \ldots, P_{m-1,1}, P_{1,2}, \ldots, P_{m-1,2}, T_1, \ldots, T_m) \]

(4) \[ \sum_{i=1}^{l-1} \sum_{j=i+1}^{l} \frac{\partial^2}{\partial x_i \partial x_j} T_{m+2} \equiv (l - 1 - \lfloor m/2 \rfloor)P_{m+1} \mod (P_{1,1}, \ldots, P_{m-1,1}, T_1, \ldots, T_m) \]

(5) \[ \sum_{j=1}^{n} \frac{\partial}{\partial x_j} S_{2m} \equiv (-1)^{n-1}2P_{2m-1,j} \mod (S_2, \ldots, S_{2n}) \]

(6) \[ \sum_{i=1}^{l-1} \sum_{j=i+1}^{l} \frac{\partial^2}{\partial x_i \partial x_j} S_{2m} \equiv (-1)^{n+1}lP_{2(m+1),1} \mod (P_1, \ldots, P_{2n-1,1}, S_2, \ldots, S_{2n}) \]

**Theorem 4.1** Let $f : U(k)/T \rightarrow U(n)/T$ be a simple map where $k > 2$.

Let \( \tilde{i} = (n - \dim(\ker{H^2(f)}))/k \). Then

\[ M_f(U(k)/T, U(n)/T) \cong \varphi(U(l)/T)^k \times U(l-1)/T \times U(n-kl)/T \times \text{odd spheres}. \]
Proof. We split the list \( \{x_1, \ldots, x_{n-1}\} \) into \( k+1 \) sublists \( \{x_1, \ldots, x_l\}, \ldots, \{x_{l(k-2)+1}, \ldots, x_{l(k-1)}\}, \{x_{l(k-1)+1}, \ldots, x_{l(n-1)}\} \) and \( \{x_{l(n)}, \ldots, x_{n-1}\} \). By the Theorem 2.3 translated to cohomology, we may take \( f^*(x_j) = t_i \) for \( x_j \) in the \( i \)th sublist \( i = 1, \ldots, k-1 \), \( f^*(x_j) = -t_1 - \cdots - t_{k-1} \) for \( x_j \) in the \( k \)th sublist and \( f^*(x_j) = 0 \) for \( x_j \) in the \( k+1 \)st sublist. To determine the differential \( d f \) in the model \( A_f = \Lambda(x_1, \ldots, x_{n-1}) \otimes_{A_f} \Lambda(Z_1) \) for \( M_f(U(k)/T, U(n)/T) \) we must solve monomials in the \( a_j = f^*(x_j) \) for monomials in the \( t_i \). Let \( e = (e_1, \ldots, e_{k-1}) \) be a \( (k-1) \)-tuple and let \( b_e \in H_{2k}(U(K)/T) \) be dual to \( t_{e_1} \cdots t_{e_{k-1}} \in H_{2k}(U(k)/T) \). The elements \( b_e \otimes y_m \) span \( Z_1 \). Using Theorem 3.2 and the binomial formula for \((-t_1 - \cdots - t_{k-1})^c\) we find

\[
d_f(b_e \otimes y_m) = \sum_{|d| \leq |e|} (-1)^d \binom{d}{d_1} \cdots \binom{d}{d_{k-1}} D_1(e_1) \cdots D_{k-1}(e_{k-1}) \circ D_k(d)(T_m)
\]

where \( d = |e| - |e| \) and \( d_i = e_i - e_i, i = 1, \ldots, k-1 \).

The idea of the proof is to show that the image of \( d f \) is precisely the ideal \( J \) of \( \Lambda_2(x_1, \ldots, x_{n-1}) \) consisting of those polynomials which are symmetric in each of the \( k+1 \) variable lists separately. Now each operator \( D_i(e_j) \) is clearly invariant under permutations of the variables in the \( i \)th sublist and trivially invariant under permutations of the variables in the other \( k \) lists. Thus if \( T \in J \) then \( D_i(e_j)(T) \in J \) also. The inclusion \( d f(\Lambda(Z_1)) \subseteq J \) follows.

To show \( d f(\Lambda(Z_1)) \supseteq J \) we first write

\[
J = (P_{1,1}, \ldots, P_{1,1}, \ldots, P_{1,k-1}, P_{1,k-1}, P_{1,k-1}, \ldots, P_{1,1}, P_{1,1}, T_1, \ldots, T_n),
\]

Regarding \( d f \) in grade one, we must show \( d f(Z_1) = \Phi(P_{1,1}, \ldots, P_{1,1}, T_1) \). Let
$b_i \in H_2(X_k)$ be dual to $t_i \in H^2(X_k)$ so that $b_i \otimes y_2 \in Z^1_k$. Then

$$d_f(b_i \otimes y_2) = \sum_{j=(k-1)+1}^{l} \frac{\partial}{\partial x_j} T_2 - \sum_{j=(k-1)+1}^{l-1} \frac{\partial}{\partial x_j} T_2 = P_{1,i} - P_{1,k} + T_1.$$ 

Next let $b_{(1,2,\ldots,0)}$ be dual to $t_1t_2 \in H^4(U(k)/T)$. Then

$$d_f(b_{(1,2,\ldots,0)} \otimes y_3) = \sum_{i=1}^{l-1} \sum_{j=(k-1)+1}^{l} \frac{\partial^2}{\partial x_i \partial x_j} T_3 - \sum_{i=1}^{l-1} \sum_{j=(k-1)+1}^{l} \frac{\partial^2}{\partial x_i \partial x_j} T_3 + \sum_{i=(k-1)+1}^{l} \frac{\partial^2}{\partial x_i^2} T_3 + 2 \sum_{i=(k-1)+1}^{l} \sum_{j=(k-1)+1}^{l} \frac{\partial^2}{\partial x_i \partial x_j} T_3 = P_{1,1} + P_{1,2} + (l+2)T_1.$$ 

A similar calculation and equations (2)-(4) give

$$d_f(b_{(2,0,\ldots,0)} \otimes y_3) \equiv 2P_{1,1} \mod (T_1),$$

where $b_{(2,0,\ldots,0)}$ is dual to $t_1^2$. Thus $d_f(\Lambda(Z^1_k)) \supseteq J^{(2)}$.

Now since that $d_f(1 \otimes y_m) = T_m$ it remains only to show the elements $P_{m,i}$, $m > 1$, are in the image of $d_f$. Using equation (1) and computing as before we have

$$d_f(b_i \otimes y_{m+1}) = \sum_{j=(k-1)+1}^{l} \frac{\partial}{\partial x_j} T_{m+1} - \sum_{j=(k-1)+1}^{l-1} \frac{\partial}{\partial x_j} T_{m+1} \equiv P_{m,i} - P_{m,k} \mod (T_1, \ldots, T_m)$$

for $i = 1, \ldots, k-1$. Similarly, using equations (2)-(4) we get

$$d_f(b_{(1,0,\ldots,0)} \otimes y_{m+2}) \equiv P_{m,1} + P_{m,2} + 2(m - 2 - 2[m/2])P_{m,k} \mod (P_{1,1}, \ldots, P_{m-1,1}, \ldots, P_{1,k}, \ldots, P_{m-1,k}, T_1, \ldots, T_m).$$

The inclusion $d_f(\Lambda(Z^1_k)) \supseteq J$ follows. \qed
Theorem 4.2 Let $f : G/T \to U(n)/T$ be a signed simple map where $G$ is simple of rank $k > 1$. Let $l = (n - \dim \ker H^2(f))/2k$. Then

$$M_f(G/T, U(n)/T) \cong \Phi(U(l)/T)^{2k-1} \times U(l-1)/T \times U(n-2kl)/T \times \text{odd spheres}.$$ 

Proof. In this case, we split the list $\{x_1, \ldots, x_{n-1}\}$ into $2k+1$ sublists: the first $2k-1$ of length $l$, the $2k$th of length $l-1$ and the last of length $n-2kl$. By Theorem 2.3, we may assume $f^*(x_j) = t_i$ for $x_j$ in the $i$th and $f^*(x_j) = -t_i$ for $x_j$ in the $i + k$th sublist $i = 1, \ldots, k$ while $f^*(x_j) = 0$ for $x_j$ in the last sublist. In this case,

$$d_j(b_{c} \otimes y_m) = \sum_{k \in H} (-1)^d D_1(e_1) \circ \cdots \circ D_k(e_k) \circ D_k(D_1(d_1) \circ \cdots \circ D_{2k}(d_k)(T_m))$$

where $d = |c| - |c|$ and $d_i = c_i - c_i$, $i = 1, \ldots, k$. The proof now proceeds in a similar manner to the above. □

Theorem 4.3 Let $f : G/T \to Sp(n)/T$ be a simple map where $G$ is simple of rank $k > 1$. Let $l = (n - \dim \ker H^2(f))/k$. Then

$$M_f(G/T, Sp(n)/T) \cong \Phi(U(l)/T)^k \times Sp(n-kl)/T \times \text{odd spheres}.$$ 

Proof. Here we split the variable list $\{x_1, \ldots, x_n\}$ into $k+1$ sublists; the first $k$ of length $l$ and the last of length $n-kl$ and take the map $f^*$ to satisfy $f^*(x_j) = t_i$ for $x_j$ in the $i$th and $f^*(x_j) = 0$ for $x_j$ in the $k+1$st sublist. By Theorem 3.2, $d_j(b_{c} \otimes y_{2m}) = D_1(e_1) \circ \cdots \circ D_k(e_k)(S_{2m})$.

This time, we show that $d_f(M(Z_1))$ equals the ideal $J$ consisting of polynomials symmetric in our first $k$ variable lists and in the squares of the
elements of the $k + 1$st variable list separately. Since the operators $D_i(c_i)$ clearly preserve this ideal, $d_f (\Lambda(Z_1)) \supseteq J$. For the reverse inclusion, observe

$$J = (P_{1,1}, \ldots, P_{l,1}, \ldots, P_{1,k}, \ldots, P_{l,k}, P_{1,k+1}, \ldots, P_{l-1,k+1}, S_2, \ldots, S_{2n}).$$

Recalling that $b_i$ is dual to $t_i \in H^2(G_i/T)$, we have

$$d_f(b_i \otimes y_2) = \sum_{j = (i-1)+1}^{\tilde{n}} \frac{\partial}{\partial x_j} S_2 = P_{1,i};$$

and $d_f(1 \otimes y_m) = S_m$ so it remains to produce the $P_{m,i}$, $m > 1$. If $m$ is odd, say $m = 2j - 1$ for $j > 1$, then by equation (5)

$$d_f(b_i \otimes y_2) = \sum_{k = (i-1)+1}^{\tilde{n}} \frac{\partial}{\partial x_k} S_{2j} \equiv (-1)^{j-1} 2P_{m,i} \mod (S_2, \ldots, S_{2j}).$$

If $m$ is even, say $m = 2j$ for $j > 1$, let $c_i = (0, \ldots, 2, \ldots, 0)$ be the $k$-tuple with a 2 in the $i$th position so that $b_{c_i} \in H_4(G_i/T)$ denotes the element dual to $t_{i}^2 \in H^4(G_i/T)$. Using (5) and (6) we find

$$d_f(b_{c_i} \otimes y_{m+2}) = \frac{1}{2} \sum_{b = (i-1)+1}^{\tilde{n}} \frac{\partial^2}{\partial x_b^2} S_{m+2} + \sum_{d = (i-1)+1}^{\tilde{n}} \sum_{k = b+1}^{\tilde{n}} \frac{\partial^2}{\partial x_d \partial x_k} S_{m+2}

\equiv (2m - 3)(-1)^{j} P_{m,i} \mod (P_{1,i}, \ldots, P_{m-1,i}, S_2, \ldots, S_{2n}).$$
